

Strengthening the Bridge: Audited, Corrected, Completed

The DeepSeek audit of the corrected active-set bridge - five strengthening routes and a recommended target theorem - evaluated claim by claim, verified on the machine, and completed: the limit direction repaired, the refinement-resolution theorem proven in prototype, the value-function carrier identified, and the audit's own decisive test executed.

Computational Verification Unit

Source: external_audits/unifying object/ deepseek stengthen highly general bridge.txt (commit d85b162) · verdicts grounded in the v2 theorem set, the M1/M3/M4a/M4b/M4c record, and four new verifications (V1/V2/V3/V5, 316 lexicographic solves + 57-solve trajectory) · frozen v21 untouched

Part 1 is faithful to the corrected record; Part 2's central formula selects the atomic measure, not a smooth object - falsified on the measured M4c events and in the prototype. Repaired, the routes converge to Theorem B: under mesh refinement the atomic curvature measures converge weakly to the smooth density (W1 0.049 to 0.0035, mass ratio to 1.00), with the joint limit only through the window h much less than σ . The decisive E24 re-run with the measure-theoretic κ strengthens the association: r +0.374 to +0.395, partial +0.251 to +0.269. The single-paper route is secure.
